

SQL Cheat Sheet

Prepared and collected by
Tonmoy Chandro Das

Supervised By
Dr. Rudra Prtap Deb Nath

Basic Needs	2
Database Management	2
DQL & DDL	2
Mysql User Management	3
Data Control Language	3
Grant Block:	3
Revoke Block:	4
Views	4
Triggers	4
TCL	4
Database Role	5
Recursion	5

And there are other topics with more details which I directly copied here. I had no time to enlist them.

Basic Needs

Show all Databases

```
Show databases;
```

Show current Database

```
select database();
```

Show current time

```
Select now();
```

Clear Command Line screen

```
\! cls;
```

Exit the system

```
EXIT;
```

Database Management

Creating a Database

```
CREATE DATABASE
```

```
databasename;
```

Drop (Delete) a Database

```
DROP DATABASE databasename;
```

Change the current Database

```
Use database_name;
```

Access a database

```
mysql -u username -p database
```

DQL & DDL

Show all Tables of current database

```
show tables;
```

Show table structure (Describe)

```
Desc table_name;
```

Create a new Table

```
CREATE TABLE table (column  
VARCHAR(120), another-column  
DATETIME AUTO_INCREMENT);
```

Drop a Table

```
DROP TABLE table;
```

Adding a column

```
ALTER TABLE table ADD COLUMN  
column VARCHAR(120);
```

Describe Table

```
DESCRIBE table_name;
```

Describe Column

```
DESCRIBE table_name  
column_name;
```

Explain records

```
EXPLAIN SELECT * FROM table;
```

Select records containing 'value'

```
SELECT * FROM table WHERE  
[column] LIKE '%value%';
```

Select records starting with 'val' and ending with 'ue'

```
SELECT * FROM table WHERE  
column LIKE 'val_ue';
```

Select a range

```
SELECT * FROM table WHERE  
column BETWEEN value1 and  
value2;
```

Removing table columns

```
ALTER TABLE table DROP COLUMN  
column;
```

Select from multiple tables

```
SELECT table1.column,  
table1.another-column,  
table2.column FROM table1,  
table2;
```

Combine rows from different tables (JOIN)

```
SELECT * FROM table1 INNER  
JOIN table2 ON table1.column =  
table2.column;
```

Show total m results starting from nth

```
SELECT * FROM table ORDER BY ID  
LIMIT n-1,m
```

Mysql User Management

Create User

```
create user username@localhost  
identified by 'password';
```

Drop a User

```
DROP USER  
'username'@'localhost', 'userna  
me'@'localhost';
```

Switch User

```
SYSTEM mysql -u USERNAME -p;
```

Show User List

```
Select user from mysql.user;
```

Describe User Table

```
Desc mysql.user;
```

Show Current User

```
Select user();
```

or

```
Select current_user();
```

Change User Password

```
ALTER USER username@localhost  
IDENTIFIED BY 'newpass';
```

Data Control Language

Grant Block:

```
GRANT privilege_name(s) ON  
object TO  
user_account_name;
```

Show all the Grants

```
show grants;
```

Show grants for a user

```
SHOW GRANTS FOR  
username@localhost;
```

Global Grant all privilege

```
GRANT ALL ON  
database_name.table_name TO  
username@localhost;
```

(Use * for indicating ALL)

Database Grant privilege

```
GRANT ALL ON mydb.* TO  
john@localhost;
```

Revoke Block:

```
REVOKE privilege_name(s) ON  
object FROM  
user_account_name;
```

Revoke All Privilege:

```
REVOKE ALL, GRANT OPTION FROM  
john@localhost;
```

Views

Show all views of a table

```
SELECT TABLE_SCHEMA, TABLE_NAME,  
VIEW_DEFINITION  
FROM information_schema.VIEWS  
WHERE TABLE_SCHEMA LIKE  
'your_db_name';
```

Describe Views table

```
DESC VIEWS;
```

Create a new view

```
CREATE VIEW view_name AS  
query;
```

Show view of a table 2

```
SHOW FULL TABLES FROM | IN  
database_name WHERE table_type  
= 'VIEW';
```

Triggers

Creating a Trigger

```
CREATE TRIGGER trigger_name  
{BEFORE | AFTER} {INSERT |  
UPDATE | DELETE} ON table_name  
FOR EACH ROW trigger_body;
```

Show triggers

```
SHOW TRIGGERS {FROM | IN}  
database_name LIKE 'pattern' |  
WHERE search_condition];
```

Dropping a Trigger

```
DROP TRIGGER trigger_name;
```

TCL

Setting autocommit

```
SET autocommit = 0 | 1;
```

Start of a Transaction

```
START TRANSACTION;
```

Committing a Transaction

```
COMMIT;
```

Rollback

```
ROLLBACK;
```

Create a savepoint

```
SAVEPOINT savepoint_name;
```

Rollback to savepoint

```
ROLLBACK TO savepoint_name;
```

Database Role

Show all Roles

```
SELECT * FROM  
mysql.role_edges;
```

Create new Role

```
CREATE ROLE 'role_name',  
'role_name-2';
```

Drop a role

```
DROP ROLE role_name;
```

Grant privileges to a role

```
GRANT SELECT ON db_n.tb_n TO  
'role_name';
```

Grant roles to a user

```
GRANT role_name TO  
'user'@'localhost';
```

Show current role

```
SELECT CURRENT_ROLE();
```

Set current role

```
set role DELL_APP_RO;
```

Show grants for a role

```
show grants for role_name;
```

Revoke from a role

```
REVOKE  
SELECT,INSERT,UPDATE,DELETE ON  
db_n.tb_n FROM role_name;
```

Revoke a role from a user

```
REVOKE Role_name FROM  
'user_name'@'localhost'
```

Recursion

```
WITH RECURSIVE  
mytable(col_name) AS (  
    Subquery - base case  
    UNION  
    SELECT ... FROM mytable  
    WHERE ...  
)  
SELECT ... FROM mytable ... ;
```

Privilege Level	Syntax	Descriptions
Global	REVOKE ALL, GRANT OPTION FROM john@localhost;	It applies to remove all access rights from the user on MySQL server.
Database	REVOKE ALL ON mydb.* FROM john@localhost;	It applies to revoke all privileges from objects in the current database.
Table	REVOKE DELETE ON mydb.employees FROM john@localhsot;	It applies to revoke privileges from all columns in a specified table.
Column	REVOKE SELECT (col1), INSERT (col1, col2), UPDATE (col2) ON mydb.mytable FROM john@localhost;	It applies to revoke privileges from a single column of a table.
Stored Routine	REVOKE EXECUTE ON PROCEDURE/FUNCTION mydb.myprocedure FROM john@localhost;	It applies to revoke all privileges from stored routines (procedure and functions).
Proxy	REVOKE PROXY ON root FROM peter@localhost;	It enables us to revoke the proxy user.

Privilege Level	Syntax	Descriptions
Global	GRANT ALL ON *.* TO john@localhost;	It applies to all databases on MySQL server. We need to use *.* syntax for applying global privileges. Here, the user can query data from all databases and tables of the current server.
Database	GRANT ALL ON mydb.* TO john@localhost;	It applies to all objects in the current database. We need to use the db_name.* syntax for applying this privilege. Here, a user can query data from all tables in the given database.
Table	GRANT DELETE ON mydb.employees TO john@localhsot;	It applies on all columns in a specified table. We need to use db_name.table_name syntax for assigning this privilege. Here, a user can query data from the given table of the specified database.
Column	GRANT SELECT (col1), INSERT (col1, col2), UPDATE (col2) ON mydb.mytable TO john@localhost;	It applies on a single column of a table. Here, we must have to specify the column(s) name enclosed with parenthesis for each privilege. The user can select one column, insert values in two columns, and update only one column in the given table.
Stored Routine	GRANT EXECUTE ON PROCEDURE mydb.myprocedure TO john@localhost;	It applies to stored routines (procedure and functions). It contains CREATE ROUTINE, ALTER ROUTINE, EXECUTE, and GRANT OPTION privileges. Here, a user can execute the stored procedure in the current database.
Proxy	GRANT PROXY ON root TO peter@localhost;	It enables one user to be a proxy for other users.

Cheat Sheet

Keywords

A collection of keywords used in SQL statements, a description, and where appropriate an example. Some of the more advanced keywords have their own dedicated section later in the cheat sheet.

Where MySQL is mentioned next to an example, this means this example is only applicable to MySQL databases (as opposed to any other database system).

SQL Keywords	
Keyword	Description
ADD	<p>Adds a new column to an existing table. Example: Adds a new column named 'email_address' to a table named 'users'.</p> <pre>ALTER TABLE users ADD email_address varchar(255);</pre>
ADD CONSTRAINT	<p>It creates a new constraint on an existing table, which is used to specify rules for any data in the table. Example: Adds a new PRIMARY KEY constraint named 'user' on columns ID and SURNAME.</p> <pre>ALTER TABLE users ADD CONSTRAINT user PRIMARY KEY (ID, SURNAME);</pre>
ALTER TABLE	<p>Adds, deletes or edits columns in a table. It can also be used to add and delete constraints in a table, as per the above. Example: Adds a new boolean column called 'approved' to a table named 'deals'.</p> <pre>ALTER TABLE deals ADD approved boolean;</pre> <p>Example 2: Deletes the 'approved' column from the 'deals' table</p> <pre>ALTER TABLE deals DROP COLUMN approved;</pre>

SQL Keywords	
Keyword	Description
ALTER COLUMN	<p>Changes the data type of a table's column. Example: In the 'users' table, make the column 'incept_date' into a 'datetime' type.</p> <pre>ALTER TABLE users ALTER COLUMN incept_date datetime;</pre>
ALL	<p>Returns true if all of the subquery values meet the passed condition. Example: Returns the users with a higher number of tasks than the user with the highest number of tasks in the HR department (id 2)</p> <pre>SELECT first_name, surname, tasks_no FROM users WHERE tasks_no > ALL (SELECT tasks FROM user WHERE department_id = 2);</pre>
AND	<p>Used to join separate conditions within a WHERE clause. Example: Returns events located in London, United Kingdom</p> <pre>SELECT * FROM events WHERE host_country='United Kingdom' AND host_ city='London';</pre>
ANY	<p>Returns true if any of the subquery values meet the given condition. Example: Returns products from the products table which have received orders – stored in the orders table – with a quantity of more than 5.</p> <pre>SELECT name FROM products WHERE productId = ANY (SELECT productId FROM orders WHERE quantity > 5);</pre>
AS	<p>Renames a table or column with an alias value which only exists for the duration of the query. Example: Aliases north_east_user_subscriptions column</p> <pre>SELECT north_east_user_subscriptions AS ne_subs FROM users WHERE ne_subs > 5;</pre>
ASC	<p>Used with ORDER BY to return the data in ascending order. Example: Apples, Bananas, Peaches, Raddish</p>

SQL Keywords	
Keyword	Description
BETWEEN	<p>Selects values within the given range.</p> <p>Example 1: Selects stock with a quantity between 100 and 150.</p> <pre>SELECT * FROM stock WHERE quantity BETWEEN 100 AND 150;</pre> <p>Example 2: Selects stock with a quantity NOT between 100 and 150. Alternatively, using the NOT keyword here reverses the logic and selects values outside the given range.</p> <pre>SELECT * FROM stock WHERE quantity NOT BETWEEN 100 AND 150;</pre>
CASE	<p>Change query output depending on conditions.</p> <p>Example: Returns users and their subscriptions, along with a new column called activity_levels that makes a judgement based on the number of subscriptions.</p> <pre>SELECT first_name, surname, subscriptions CASE WHEN subscriptions > 10 THEN 'Very active' WHEN Quantity BETWEEN 3 AND 10 THEN 'Active' ELSE 'Inactive' END AS activity_levels FROM users;</pre>
CHECK	<p>Adds a constraint that limits the value which can be added to a column.</p> <p>Example 1 (MySQL): Makes sure any users added to the users table are 18 or over.</p> <pre>CREATE TABLE users (first_name varchar(255), age int, CHECK (age>=18));</pre> <p>Example 2 (MySQL): Adds a check after the table has already been created.</p> <pre>ALTER TABLE users ADD CHECK (age>=18);</pre>

SQL Keywords	
Keyword	Description
CREATE DATABASE	<p>Creates a new database. Example: Creates a new database named 'websitesetup'.</p> <pre>CREATE DATABASE websitesetup;</pre>
CREATE TABLE	<p>Creates a new table . Example: Creates a new table called 'users' in the 'websitesetup' database.</p> <pre>CREATE TABLE users (id int, first_name varchar(255), surname varchar(255), address varchar(255), contact_number int);</pre>
DEFAULT	<p>Sets a default value for a column; Example 1 (MySQL): Creates a new table called Products which has a name column with a default value of 'Placeholder Name' and an available_from column with a default value of today's date.</p> <pre>CREATE TABLE products (id int, name varchar(255) DEFAULT 'Placeholder Name', available_from date DEFAULT GETDATE());</pre> <p>Example 2 (MySQL): The same as above, but editing an existing table.</p> <pre>ALTER TABLE products ALTER name SET DEFAULT 'Placeholder Name', ALTER available_from SET DEFAULT GETDATE();</pre>
DELETE	<p>Delete data from a table. Example: Removes a user with a user_id of 674.</p> <pre>DELETE FROM users WHERE user_id = 674;</pre>
DESC	<p>Used with ORDER BY to return the data in descending order. Example: Raddish, Peaches, Bananas, Apples</p>

SQL Keywords	
Keyword	Description
DROP COLUMN	<p>Deletes a column from a table. Example: Removes the first_name column from the users table.</p> <pre>ALTER TABLE users DROP COLUMN first_name</pre>
DROP DATABASE	<p>Deletes the entire database. Example: Deletes a database named 'websitesetup'.</p> <pre>DROP DATABASE websitesetup;</pre>
DROP DEFAULT	<p>Removes a default value for a column. Example (MySQL): Removes the default value from the 'name' column in the 'products' table.</p> <pre>ALTER TABLE products ALTER COLUMN name DROP DEFAULT;</pre>
DROP TABLE	<p>Deletes a table from a database. Example: Removes the users table.</p> <pre>DROP TABLE users;</pre>
EXISTS	<p>Checks for the existence of any record within the subquery, returning true if one or more records are returned. Example: Lists any dealerships with a deal finance percentage less than 10.</p> <pre>SELECT dealership_name FROM dealerships WHERE EXISTS (SELECT deal_name FROM deals WHERE dealership_id = deals.dealership_id AND finance_ percentage < 10);</pre>
FROM	<p>Specifies which table to select or delete data from. Example: Selects data from the users table.</p> <pre>SELECT area_manager FROM area_managers WHERE EXISTS (SELECT ProductName FROM Products WHERE area_manager_id = deals.area_manager_id AND Price < 20);</pre>

SQL Keywords	
Keyword	Description
IN	<p>Used alongside a WHERE clause as a shorthand for multiple OR conditions. So instead of:</p> <pre>SELECT * FROM users WHERE country = 'USA' OR country = 'United Kingdom' OR country = 'Russia' OR country = 'Australia';</pre> <p>You can use:</p> <pre>SELECT * FROM users WHERE country IN ('USA', 'United Kingdom', 'Russia', 'Australia');</pre>
INSERT INTO	<p>Add new rows to a table. Example: Adds a new vehicle.</p> <pre>INSERT INTO cars (make, model, mileage, year) VALUES ('Audi', 'A3', 30000, 2016);</pre>
IS NULL	<p>Tests for empty (NULL) values. Example: Returns users that haven't given a contact number.</p> <pre>SELECT * FROM users WHERE contact_number IS NULL;</pre>
IS NOT NULL	<p>The reverse of NULL. Tests for values that aren't empty / NULL.</p>
LIKE	<p>Returns true if the operand value matches a pattern. Example: Returns true if the user's first_name ends with 'son'.</p> <pre>SELECT * FROM users WHERE first_name LIKE '%son';</pre>
NOT	<p>Returns true if a record DOESN'T meet the condition. Example: Returns true if the user's first_name doesn't end with 'son'.</p> <pre>SELECT * FROM users WHERE first_name NOT LIKE '%son';</pre>
OR	<p>Used alongside WHERE to include data when either condition is true. Example: Returns users that live in either Sheffield or Manchester.</p> <pre>SELECT * FROM users WHERE city = 'Sheffield' OR 'Manchester';</pre>

SQL Keywords	
Keyword	Description
ORDER BY	<p>Used to sort the result data in ascending (default) or descending order through the use of ASC or DESC keywords. Example: Returns countries in alphabetical order.</p> <pre>SELECT * FROM countries ORDER BY name;</pre>
ROWNUM	<p>Returns results where the row number meets the passed condition. Example: Returns the top 10 countries from the countries table.</p> <pre>SELECT * FROM countries WHERE ROWNUM <= 10;</pre>
SELECT	<p>Used to select data from a database, which is then returned in a results set. Example 1: Selects all columns from all users.</p> <pre>SELECT * FROM users;</pre> <p>Example 2: Selects the first_name and surname columns from all users.xx</p> <pre>SELECT first_name, surname FROM users;</pre>
SELECT DISTINCT	<p>Sames as SELECT, except duplicate values are excluded. Example: Creates a backup table using data from the users table.</p> <pre>SELECT * INTO usersBackup2020 FROM users;</pre>
SELECT INTO	<p>Copies data from one table and inserts it into another. Example: Returns all countries from the users table, removing any duplicate values (which would be highly likely)</p> <pre>SELECT DISTINCT country from users;</pre>
SELECT TOP	<p>Allows you to return a set number of records to return from a table. Example: Returns the top 3 cars from the cars table.</p> <pre>SELECT TOP 3 * FROM cars;</pre>

SQL Keywords	
Keyword	Description
SET	<p>Used alongside UPDATE to update existing data in a table. Example: Updates the value and quantity values for an order with an id of 642 in the orders table.</p> <pre>UPDATE orders SET value = 19.49, quantity = 2 WHERE id = 642;</pre>
SOME	Identical to ANY.
TOP	<p>Used alongside SELECT to return a set number of records from a table. Example: Returns the top 5 users from the users table.</p> <pre>SELECT TOP 5 * FROM users;</pre>
TRUNCATE TABLE	<p>Similar to DROP, but instead of deleting the table and its data, this deletes only the data. Example: Empties the sessions table, but leaves the table itself intact.</p> <pre>TRUNCATE TABLE sessions;</pre>
UNION	<p>Combines the results from 2 or more SELECT statements and returns only distinct values. Example: Returns the cities from the events and subscribers tables.</p> <pre>SELECT city FROM events UNION SELECT city from subscribers;</pre>
UNION ALL	The same as UNION, but includes duplicate values.

SQL Keywords	
Keyword	Description
UNIQUE	<p>This constraint ensures all values in a column are unique. Example 1 (MySQL): Adds a unique constraint to the id column when creating a new users table.</p> <pre>CREATE TABLE users (id int NOT NULL, name varchar(255) NOT NULL, UNIQUE (id));</pre> <p>Example 2 (MySQL): Alters an existing column to add a UNIQUE constraint.</p> <pre>ALTER TABLE users ADD UNIQUE (id);</pre>
UPDATE	<p>Updates existing data in a table. Example: Updates the mileage and serviceDue values for a vehicle with an id of 45 in the cars table.</p> <pre>UPDATE cars SET mileage = 23500, serviceDue = 0 WHERE id = 45;</pre>
VALUES	<p>Used alongside the INSERT INTO keyword to add new values to a table. Example: Adds a new car to the cars table.</p> <pre>INSERT INTO cars (name, model, year) VALUES ('Ford', 'Fiesta', 2010);</pre>
WHERE	<p>Filters results to only include data which meets the given condition. Example: Returns orders with a quantity of more than 1 item.</p> <pre>SELECT * FROM orders WHERE quantity > 1;</pre>

MySQL Data Types

When creating a new table or editing an existing one, you must specify the type of data that each column accepts.

In the below example, data passed to the id column must be an int, whilst the first_name column has a VARCHAR data type with a maximum of 255 characters.

```
CREATE TABLE users (  
    id int,  
    first_name varchar(255)  
);
```

String Data Types

String Data Types	
Data Type	Description
CHAR(size)	Fixed length string which can contain letters, numbers and special characters. The size parameter sets the maximum string length, from 0 – 255 with a default of 1.
VARCHAR(size)	Variable length string similar to CHAR(), but with a maximum string length range from 0 to 65535.
BINARY(size)	Similar to CHAR() but stores binary byte strings.
VARBINARY(size)	Similar to VARCHAR() but for binary byte strings.
TINYBLOB	Holds Binary Large Objects (BLOBs) with a max length of 255 bytes.
TINYTEXT	Holds a string with a maximum length of 255 characters. Use VARCHAR() instead, as it's fetched much faster.
TEXT(size)	Holds a string with a maximum length of 65535 bytes. Again, better to use VARCHAR().
BLOB(size)	Holds Binary Large Objects (BLOBs) with a max length of 65535 bytes.
MEDIUMTEXT	Holds a string with a maximum length of 16,777,215 characters.

String Data Types	
Data Type	Description
MEDIUMBLOB	Holds Binary Large Objects (BLOBs) with a max length of 16,777,215 bytes.
LONGTEXT	Holds a string with a maximum length of 4,294,967,295 characters.
LOBLOB	Holds Binary Large Objects (BLOBs) with a max length of 4,294,967,295 bytes.
ENUM(a, b, c, etc...)	<p>A string object that only has one value, which is chosen from a list of values which you define, up to a maximum of 65535 values. If a value is added which isn't on this list, it's replaced with a blank value instead. Think of ENUM being similar to HTML radio boxes in this regard.</p> <pre>CREATE TABLE tshirts (color ENUM('red', 'green', 'blue', 'yellow', 'purple'));</pre>
SET(a, b, c, etc...)	A string object that can have 0 or more values, which is chosen from a list of values which you define, up to a maximum of 64 values. Think of SET being similar to HTML checkboxes in this regard.

Numeric Data Types

Numeric Data Types	
Data Type	Description
BIT(size)	A bit-value type with a default of 1. The allowed number of bits in a value is set via the size parameter, which can hold values from 1 to 64.
TINYINT(size)	A very small integer with a signed range of -128 to 127, and an unsigned range of 0 to 255. Here, the size parameter specifies the maximum allowed display width, which is 255.
BOOL	Essentially a quick way of setting the column to TINYINT with a size of 1. 0 is considered false, whilst 1 is considered true.
BOOLEAN	Same as BOOL.
SMALLINT(size)	A small integer with a signed range of -32768 to 32767, and an unsigned range from 0 to 65535. Here, the size parameter specifies the maximum allowed display width, which is 255.

Numeric Data Types	
Data Type	Description
MEDIUMINT(size)	A medium integer with a signed range of -8388608 to 8388607, and an unsigned range from 0 to 16777215. Here, the size parameter specifies the maximum allowed display width, which is 255.
INT(size)	A medium integer with a signed range of -2147483648 to 2147483647, and an unsigned range from 0 to 4294967295. Here, the size parameter specifies the maximum allowed display width, which is 255.
INTEGER(size)	Same as INT.
BIGINT(size)	A medium integer with a signed range of -9223372036854775808 to 9223372036854775807, and an unsigned range from 0 to 18446744073709551615. Here, the size parameter specifies the maximum allowed display width, which is 255.
FLOAT(p)	A floating point number value. If the precision (p) parameter is between 0 to 24, then the data type is set to FLOAT(), whilst if its from 25 to 53, the data type is set to DOUBLE(). This behaviour is to make the storage of values more efficient.
DOUBLE(size, d)	A floating point number value where the total digits are set by the size parameter, and the number of digits after the decimal point is set by the d parameter.
DECIMAL(size, d)	<p>An exact fixed point number where the total number of digits is set by the size parameters, and the total number of digits after the decimal point is set by the d parameter.</p> <p>For size, the maximum number is 65 and the default is 10, whilst for d, the maximum number is 30 and the default is 10.</p>
DEC(size, d)	Same as DECIMAL.

Date / Time Data Types

Date / Time Data Types	
Data Type	Description
DATE	A simple date in YYYY-MM-DD format, with a supported range from '1000-01-01' to '9999-12-31'.
DATETIME(fsp)	<p>A date time in YYYY-MM-DD hh:mm:ss format, with a supported range from '1000-01-01 00:00:00' to '9999-12-31 23:59:59'.</p> <p>By adding DEFAULT and ON UPDATE to the column definition, it automatically sets to the current date/time.</p>
TIMESTAMP(fsp)	<p>A Unix Timestamp, which is a value relative to the number of seconds since the Unix epoch ('1970-01-01 00:00:00' UTC). This has a supported range from '1970-01-01 00:00:01' UTC to '2038-01-09 03:14:07' UTC.</p> <p>By adding DEFAULT CURRENT_TIMESTAMP and ON UPDATE CURRENT_TIMESTAMP to the column definition, it automatically sets to current date/time.</p>
TIME(fsp)	A time in hh:mm:ss format, with a supported range from '-838:59:59' to '838:59:59'.
YEAR	A year, with a supported range of '1901' to '2155'.

Operators

Arithmetic Operators

Arithmetic Operators	
Operator	Description
+	Add
-	Subtract
*	Multiply
/	Divide
%	Modulo

Bitwise Operator

Bitwise Operator	
Operator	Description
&	Bitwise AND
	Bitwise OR
^	Bitwise exclusive OR

Comparison Operators

Comparison Operators	
Operator	Description
=	Equal to
>	Greater than
<	Less than
>=	Greater than or equal to
<=	Less than or equal to
≠	Not equal to

Compound Operators

Compound Operators	
Operator	Description
<code>+=</code>	Add equals
<code>-=</code>	Subtract equals
<code>*=</code>	Multiply equals
<code>/=</code>	Divide equals
<code>%=</code>	Modulo equals
<code>&=</code>	Bitwise AND equals
<code>^-=</code>	Bitwise exclusive equals
<code> *=</code>	Bitwise OR equals

Functions

String Functions

String Functions	
Name	Description
ASCII	Returns the equivalent ASCII value for a specific character.
CHAR_LENGTH	Returns the character length of a string.
CHARACTER_LENGTH	Same as CHAR_LENGTH.
CONCAT	Adds expressions together, with a minimum of 2.
CONCAT_WS	Adds expressions together, but with a separator between each value.
FIELD	Returns an index value relative to the position of a value within a list of values.
FIND IN SET	Returns the position of a string in a list of strings.
FORMAT	When passed a number, returns that number formatted to include commas (eg 3,400,000).
INSERT	Allows you to insert one string into another at a certain point, for a certain number of characters.
INSTR	Returns the position of the first time one string appears within another.
LCASE	Convert a string to lowercase.
LEFT	Starting from the left, extract the given number of characters from a string and return them as another.
LENGTH	Returns the length of a string, but in bytes.
LOCATE	Returns the first occurrence of one string within another,
LOWER	Same as LCASE.
LPAD	Left pads one string with another, to a specific length.
LTRIM	Remove any leading spaces from the given string.

String Functions	
Name	Description
MID	Extracts one string from another, starting from any position.
POSITION	Returns the position of the first time one substring appears within another.
REPEAT	Allows you to repeat a string
REPLACE	Allows you to replace any instances of a substring within a string, with a new substring.
REVERSE	Reverses the string.
RIGHT	Starting from the right, extract the given number of characters from a string and return them as another.
RPAD	Right pads one string with another, to a specific length.
RTRIM	Removes any trailing spaces from the given string.
SPACE	Returns a string full of spaces equal to the amount you pass it.
STRCMP	Compares 2 strings for differences
SUBSTR	Extracts one substring from another, starting from any position.
SUBSTRING	Same as SUBSTR
SUBSTRING_INDEX	Returns a substring from a string before the passed substring is found the number of times equals to the passed number.
TRIM	Removes trailing and leading spaces from the given string. Same as if you were to run LTRIM and RTRIM together.
UCASE	Convert a string to uppercase.
UPPER	Same as UCASE.

Numeric Functions

Numeric Functions	
Name	Description
ABS	Returns the absolute value of the given number.
ACOS	Returns the arc cosine of the given number.
ASIN	Returns the arc sine of the given number.
ATAN	Returns the arc tangent of one or 2 given numbers.
ATAN2	Return the arc tangent of 2 given numbers.
AVG	Returns the average value of the given expression.
CEIL	Returns the closest whole number (integer) upwards from a given decimal point number.
CEILING	Same as CEIL.
COS	Returns the cosine of a given number.
COT	Returns the cotangent of a given number.
COUNT	Returns the amount of records that are returned by a SELECT query.
DEGREES	Converts a radians value to degrees.
DIV	Allows you to divide integers.
EXP	Returns e to the power of the given number.
FLOOR	Returns the closest whole number (integer) downwards from a given decimal point number.
GREATEST	Returns the highest value in a list of arguments.
LEAST	Returns the smallest value in a list of arguments.
LN	Returns the natural logarithm of the given number
LOG	Returns the natural logarithm of the given number, or the logarithm of the given number to the given base
LOG10	Does the same as LOG, but to base 10.

Numeric Functions	
Name	Description
LOG2	Does the same as LOG, but to base 2.
MAX	Returns the highest value from a set of values.
MIN	Returns the lowest value from a set of values.
MOD	Returns the remainder of the given number divided by the other given number.
PI	Returns PI.
POW	Returns the value of the given number raised to the power of the other given number.
POWER	Same as POW.
RADIANS	Converts a degrees value to radians.
RAND	Returns a random number.
ROUND	Round the given number to the given amount of decimal places.
SIGN	Returns the sign of the given number.
SIN	Returns the sine of the given number.
SQRT	Returns the square root of the given number.
SUM	Returns the value of the given set of values combined.
TAN	Returns the tangent of the given number.
TRUNCATE	Returns a number truncated to the given number of decimal places.

Date Functions

Numeric Functions	
Name	Description
ADDDATE	Add a date interval (eg: 10 DAY) to a date (eg: 20/01/20) and return the result (eg: 20/01/30).
ADDTIME	Add a time interval (eg: 02:00) to a time or datetime (05:00) and return the result (07:00).
CURDATE	Get the current date.
CURRENT_DATE	Same as CURDATE.
CURRENT_TIME	Get the current time.
CURRENT_TIMESTAMP	Get the current date and time.
CURTIME	Same as CURRENT_TIME.
DATE	Extracts the date from a datetime expression.
DATEDIFF	Returns the number of days between the 2 given dates.
DATE_ADD	Same as ADDDATE.
DATE_FORMAT	Formats the date to the given pattern.
DATE_SUB	Subtract a date interval (eg: 10 DAY) to a date (eg: 20/01/20) and return the result (eg: 20/01/10).
DAY	Returns the day for the given date.
DAYNAME	Returns the weekday name for the given date.
DAYOFWEEK	Returns the index for the weekday for the given date.
DAYOFYEAR	Returns the day of the year for the given date.
EXTRACT	Extract from the date the given part (eg MONTH for 20/01/20 = 01).
FROM DAYS	Return the date from the given numeric date value.
HOUR	Return the hour from the given date.

Numeric Functions	
Name	Description
LAST DAY	Get the last day of the month for the given date.
LOCALTIME	Gets the current local date and time.
LOCALTIMESTAMP	Same as LOCALTIME.
MAKEDATE	Creates a date and returns it, based on the given year and number of days values.
MAKETIME	Creates a time and returns it, based on the given hour, minute and second values.
MICROSECOND	Returns the microsecond of a given time or datetime.
MINUTE	Returns the minute of the given time or datetime.
MONTH	Returns the month of the given date.
MONTHNAME	Returns the name of the month of the given date.
NOW	Same as LOCALTIME.
PERIOD_ADD	Adds the given number of months to the given period.
PERIOD_DIFF	Returns the difference between 2 given periods.
QUARTER	Returns the year quarter for the given date.
SECOND	Returns the second of a given time or datetime.
SEC_TO_TIME	Returns a time based on the given seconds.
STR_TO_DATE	Creates a date and returns it based on the given string and format.
SUBDATE	Same as DATE_SUB.
SUBTIME	Subtracts a time interval (eg: 02:00) to a time or datetime (05:00) and return the result (03:00).
SYSDATE	Same as LOCALTIME.
TIME	Returns the time from a given time or datetime.
TIME_FORMAT	Returns the given time in the given format.

Numeric Functions	
Name	Description
TIME_TO_SEC	Converts and returns a time into seconds.
TIMEDIFF	Returns the difference between 2 given time/datetime expressions.
TIMESTAMP	Returns the datetime value of the given date or datetime.
TO_DAYS	Returns the total number of days that have passed from '00-00-0000' to the given date.
WEEK	Returns the week number for the given date.
WEEKDAY	Returns the weekday number for the given date.
WEEKOFYEAR	Returns the week number for the given date.
YEAR	Returns the year from the given date.
YEARWEEK	Returns the year and week number for the given date.

Misc Functions

Numeric Functions	
Name	Description
IN	Returns the given number in binary.
BINARY	Returns the given value as a binary string.
CAST	Convert one type into another.
COALESCE	From a list of values, return the first non-null value.
CONNECTION_ID	For the current connection, return the unique connection ID.
CONV	Convert the given number from one numeric base system into another.
CONVERT	Convert the given value into the given datatype or character set.
CURRENT_USER	Return the user and hostname which was used to authenticate with the server.
DATABASE	Get the name of the current database.
GROUP BY	<p>Used alongside aggregate functions (COUNT, MAX, MIN, SUM, AVG) to group the results.</p> <p>Example: Lists the number of users with active orders.</p> <pre>SELECT COUNT(user_id), active_orders FROM users GROUP BY active_orders;</pre> <p>It's used in the place of WHERE with aggregate functions.</p>
HAVING	<p>Example: Lists the number of users with active orders, but only include users with more than 3 active orders.</p> <pre>SELECT COUNT(user_id), active_orders FROM users GROUP BY active_orders HAVING COUNT(user_id) > 3;</pre>
IF	If the condition is true return a value, otherwise return another value.
IFNULL	If the given expression equates to null, return the given value.

Numeric Functions	
Name	Description
ISNULL	If the expression is null, return 1, otherwise return 0.
LAST_INSERT_ID	For the last row which was added or updated in a table, return the auto increment ID.
NULLIF	Compares the 2 given expressions. If they are equal, NULL is returned, otherwise the first expression is returned.
SESSION_USER	Return the current user and hostnames.
SYSTEM_USER	Same as SESSION_USER.
USER	Same as SESSION_USER.
VERSION	Returns the current version of the MySQL powering the database.

Wildcard Characters

In SQL, Wildcards are special characters used with the LIKE and NOT LIKE keywords which allow us to search data with sophisticated patterns much more efficiently

Wildcards	
Name	Description
%	<p>Equates to zero or more characters.</p> <p>Example 1: Find all users with surnames ending in 'son'.</p> <pre>SELECT * FROM users WHERE surname LIKE '%son';</pre> <p>Example 2: Find all users living in cities containing the pattern 'che'</p> <pre>SELECT * FROM users WHERE city LIKE '%che%';</pre>
_	<p>Equates to any single character.</p> <p>Example: Find all users living in cities beginning with any 3 characters, followed by 'chester'.</p> <pre>SELECT * FROM users WHERE city LIKE '___chester';</pre>
[charlist]	<p>Equates to any single character in the list.</p> <p>Example 1: Find all users with first names beginning with J, H or M.</p> <pre>SELECT * FROM users WHERE first_name LIKE '[jhm]%';</pre> <p>Example 2: Find all users with first names beginning letters between A-L.</p> <pre>SELECT * FROM users WHERE first_name LIKE '[a-l]%';</pre> <p>Example 3: Find all users with first names not ending with letters between n-s.</p> <pre>SELECT * FROM users WHERE first_name LIKE '%[!n-s]';</pre>

Keys

In relational databases, there is a concept of primary and foreign keys. In SQL tables, these are included as constraints, where a table can have a primary key, a foreign key, or both.

Primary Key

A primary key allows each record in a table to be uniquely identified. There can only be one primary key per table, and you can assign this constraint to any single or combination of columns. However, this means each value within this column(s) must be unique.

Typically in a table, the primary key is an ID column, and is usually paired with the AUTO_INCREMENT keyword. This means the value increases automatically as new records are created.

Example 1 (MySQL)

Create a new table and set the primary key to the ID column.

```
CREATE TABLE users (  
  id int NOT NULL AUTO_INCREMENT,  
  first_name varchar(255),  
  last_name varchar(255) NOT NULL,  
  address varchar(255),  
  email varchar(255),  
  PRIMARY KEY (id)  
);
```

Example 2 (MySQL)

Alter an existing table and set the primary key to the first_name column.

```
ALTER TABLE users  
ADD PRIMARY KEY (first_name);
```

Foreign Key

A foreign key can be applied to one column or many and is used to link 2 tables together in a relational database.

As seen in the diagram below, the table containing the foreign key is called the child key, whilst the table which contains the referenced key, or candidate key, is called the parent table.

This essentially means that the column data is shared between 2 tables, as a foreign key also prevents invalid data from being inserted which isn't also present in the parent table.

Example 1 (MySQL)

Create a new table and turn any columns that reference IDs in other tables into foreign keys.

```
CREATE TABLE orders (
  id int NOT NULL,
  user_id int,
  product_id int,
  PRIMARY KEY (id),
  FOREIGN KEY (user_id) REFERENCES users(id),
  FOREIGN KEY (product_id) REFERENCES products(id)
);
```

Example 2 (MySQL)

Alter an existing table and create a foreign key.

```
ALTER TABLE orders
ADD FOREIGN KEY (user_id) REFERENCES users(id);
```

Indexes

Indexes are attributes that can be assigned to columns that are frequently searched against to make data retrieval a quicker and more efficient process.

This doesn't mean each column should be made into an index though, as it takes longer for a column with an index to be updated than a column without. This is because when indexed columns are updated, the index itself must also be updated.

Wildcards	
Name	Description
CREATE INDEX	<p>Creates an index named 'idx_test' on the first_name and surname columns of the users table. In this instance, duplicate values are allowed.</p> <pre>CREATE INDEX idx_test ON users (first_name, surname);</pre>
CREATE UNIQUE INDEX	<p>Creates an index named 'idx_test' on the first_name and surname columns of the users table. In this instance, duplicate values are allowed.</p> <pre>CREATE UNIQUE INDEX idx_test ON users (first_name, surname);</pre>
DROP INDEX	<p>Creates an index named 'idx_test' on the first_name and surname columns of the users table. In this instance, duplicate values are allowed.</p> <pre>ALTER TABLE users DROP INDEX idx_test;</pre>

```
SELECT orders.id, users.first_name, users.surname, products.name as 'product name'
FROM orders
INNER JOIN users on orders.user_id = users.id
INNER JOIN products on orders.product_id = products.id;
```

Would return a results set which looks like:

Inner Join Result Set			
id	first_name	surname	product name
1	Oliver	Harrison	10 X Plasti...
2	Claire	Simpson	TripLast 33...
3	James	Gilbert	StorePac 5...
4	Bryony	Brown	10 X Plasti...
5	Luke	Harison	Large Car...
6	Luke	Harrison	Set of 2 S...
7	Luke	Harrison	A4 Storag...
8	Robyn	Gilbert	SmartMo...
9	Oliver	Harrison	Cardboar...
10	Thomas	Smith	10 X Plasti...

View

A view is essentially a SQL results set that get stored in the database under a label, so you can return to it later, without having to rerun the query. These are especially useful when you have a costly SQL query which may be needed a number of times, so instead of running it over and over to generate the same results set, you can just do it once and save it as a view.

Creating Views

To create a view, you can do so like this:

```
CREATE VIEW priority_users AS  
SELECT * FROM users  
WHERE country = 'United Kingdom';
```

Then in future, if you need to access the stored result set, you can do so like this:

```
SELECT * FROM [priority_users];
```

Replacing Views

With the CREATE OR REPLACE command, a view can be updated.

```
CREATE OR REPLACE VIEW [priority_users] AS  
SELECT * FROM users  
WHERE country = 'United Kingdom' OR country='USA';
```

Deleting Views

To delete a view, simply use the DROP VIEW command.

```
DROP VIEW priority_users;
```
